

## 1 RSA Practice

Consider the following RSA schemes and solve for asked variables.

- (a) Assume for an RSA scheme we pick 2 primes  $p = 5$  and  $q = 11$  with encryption key  $e = 9$ , what is the decryption key  $d$ ? Calculate the exact value.
- (b) If the receiver gets 4, what was the original message?
- (c) Encode your answer from part (b) to check its correctness.

## 2 RSA Practice

Bob would like to receive encrypted messages from Alice via RSA.

- (a) Bob chooses  $p = 7$  and  $q = 11$ . His public key is  $(N, e)$ . What is  $N$ ?
- (b) What number is  $e$  relatively prime to?
- (c)  $e$  need not be prime itself, but what is the smallest prime number  $e$  can be? Use this value for  $e$  in all subsequent computations.
- (d) What is  $\gcd(e, (p-1)(q-1))$ ?
- (e) What is the decryption exponent  $d$ ?

- (f) Now imagine that Alice wants to send Bob the message 30. She applies her encryption function  $E$  to 30. What is her encrypted message?
- (g) Bob receives the encrypted message, and applies his decryption function  $D$  to it. What is  $D$  applied to the received message?

### 3 RSA Lite

Woody misunderstood how to use RSA. So he selected prime  $P = 101$  and encryption exponent  $e = 67$ , and encrypted his message  $m$  to get  $35 = m^e \bmod P$ . Unfortunately he forgot his original message  $m$  and only stored the encrypted value 35. But Carla thinks she can figure out how to recover  $m$  from  $35 = m^e \bmod P$ , with knowledge only of  $P$  and  $e$ . Is she right? Can you help her figure out the message  $m$ ? Show all your work.

### 4 RSA with Three Primes

Show how you can modify the RSA encryption method to work with three primes instead of two primes (i.e.  $N = pqr$  where  $p, q, r$  are all prime), and prove the scheme you come up with works in the sense that  $D(E(x)) \equiv x \pmod{N}$ .
