

1 Chinese Remainder Theorem Practice

In this question, you will solve for a natural number x such that,

$$\begin{aligned}x &\equiv 2 \pmod{3} \\x &\equiv 3 \pmod{5} \\x &\equiv 4 \pmod{7}\end{aligned}\tag{1}$$

(a) Suppose you find 3 natural numbers a, b, c that satisfy the following properties:

$$a \equiv 2 \pmod{3} ; a \equiv 0 \pmod{5} ; a \equiv 0 \pmod{7},\tag{2}$$

$$b \equiv 0 \pmod{3} ; b \equiv 3 \pmod{5} ; b \equiv 0 \pmod{7},\tag{3}$$

$$c \equiv 0 \pmod{3} ; c \equiv 0 \pmod{5} ; c \equiv 4 \pmod{7}.\tag{4}$$

Show how you can use the knowledge of a, b and c to compute an x that satisfies (1).

In the following parts, you will compute natural numbers a, b and c that satisfy the above 3 conditions and use them to find an x that indeed satisfies (1).

(b) Find a natural number a that satisfies (2). In particular, an a such that $a \equiv 2 \pmod{3}$ and is a multiple of 5 and 7. It may help to approach the following problem first:

(b.i) Find a^* , the multiplicative inverse of 5×7 modulo 3. What do you see when you compute $(5 \times 7) \times a^*$ modulo 3, 5 and 7? What can you then say about $(5 \times 7) \times (2 \times a^*)$?

(c) Find a natural number b that satisfies (3). In other words: $b \equiv 3 \pmod{5}$ and is a multiple of 3 and 7.

(d) Find a natural number c that satisfies (4). That is, c is a multiple of 3 and 5 and $c \equiv 4 \pmod{7}$.

(e) Putting together your answers for Part (a), (b), (c) and (d), report an x that indeed satisfies (1).

2 CRT Decomposition

In this problem we will find $3^{302} \pmod{385}$.

- (a) Write 385 as a product of prime numbers in the form $385 = p_1 \times p_2 \times p_3$.
- (b) Use Fermat's Little Theorem to find $3^{302} \pmod{p_1}$, $3^{302} \pmod{p_2}$, and $3^{302} \pmod{p_3}$.
- (c) Let $x = 3^{302}$. Use part (b) to express the problem as a system of congruences (modular equations $\pmod{385}$). Solve the system using the Chinese Remainder Theorem. What is $3^{302} \pmod{385}$?

3 Baby Fermat

Assume that a does have a multiplicative inverse \pmod{m} . Let us prove that its multiplicative inverse can be written as $a^k \pmod{m}$ for some $k \geq 0$.

- (a) Consider the sequence $a, a^2, a^3, \dots \pmod{m}$. Prove that this sequence has repetitions.
(**Hint:** Consider the Pigeonhole Principle.)
- (b) Assuming that $a^i \equiv a^j \pmod{m}$, where $i > j$, what can you say about $a^{i-j} \pmod{m}$?
- (c) Prove that the multiplicative inverse can be written as $a^k \pmod{m}$. What is k in terms of i and j ?
